

DT Logger Armor

DT Logger Armor

Mesa's new DataTrace Logger Armor offers a robust, heat-resistant casing for MPRF DataTrace data loggers. Each data logger unit is designed to not only protect the electronics of the logger, but also to provide the user with greater convenience placing the logger probe within the product and positioning the logger within the process.

In an extreme environment, considerations must be made to protect the body of the data logger and to ensure the delivery of the data. Made to protect your investment from the harsh exposure to the most extreme process environments, DataTrace Logger Armor fits over the existing casing for the MPRF temperature data loggers and offers a few additional benefits making the utilization of loggers much more convenient for the user.

DataTrace Armor technology is part of the DataTrace Sentinel Monitoring System which allows for real-time transmission of key parameters so that the accurate determinations can be made about the product within the process and product can be removed from the process at the most efficient and appropriate time, eliminating the need for manual temperature verification.

Specifications:

Operating temperatures:	-40C to 100C (up to 140C available upon request)
Height:	5.275"
Diameter:	1.49"
Bale Length:	2.2"
